Topic: Textual stock market report details

Apple Inc (AAPL) closed Wednesday, Jan. 6, at \$126.60, down 4.6% so far in 2021. The stock set its all-time intraday high of \$138.79 on Dec. 29 and is down 8.8% from this high. Apple is also in a bull market over the past 52 weeks. It's up 138.2% from its March 23, 2020, low of \$53.15. The stock has been trading back and forth around its quarterly pivot at \$129.97 for each day of January so far. The closes on Dec. 31, 2020, were inputs to my proprietary analytics and resulted in new monthly, quarterly, semiannual, and annual levels. Each uses the last nine closes in these time horizons. New weekly levels are calculated after the end of each week. New monthly levels occur after the close of each month. New quarterly levels occur at the end of each quarter. Semiannual levels are updated at mid-year. Annual levels are in play all year long. My theory is that nine years of volatility between closes are enough to assume that all possible bullish or bearish events for the stock are factored in. To capture share price volatility, investors should buy shares on weakness to a value level and reduce holdings on strength to a risky level. A pivot is a value level or risky level that was violated within its time horizon. Pivots act as magnets that have a high probability of being tested again before their time horizon expires.
